Bibliography of Excluded* Studies

**Primary Reason for Exclusion:** No control group and/or not designed to address intervention impact on mammography use.

---

*Inclusion criteria for this synthesis required the recovery of post-intervention screening rates for all intervention and control groups. More recently, some excellent studies employed statistical methods that made the best use of their study design and data, but the results reported in the journal did not allow us to estimate the post-intervention screening rates.*

**Primary Reason for Exclusion:** Outcomes reported not sufficiently described or insufficient data for use in meta-analysis.

**Primary Reason for Exclusion:** Only system-directed or provider-directed intervention or outcome.2

---

2 **Note that we did not do an exhaustive search of provider-directed interventions, since meta-analyses of these studies have already been published. We included studies with provider-directed strategies only if they also reported patient outcomes. This list only reflects the studies that initially met our inclusion criteria, but on closer inspection did not meet our requirements.**

**Primary Reason for Exclusion: Does not report the intervention effect for a diverse population.**

Reported preliminary findings, pilot study, descriptive, process evaluation or needs assessment.
