## ABOUT THE COVER

The cover image was adapted from Figure 3 in the article in this issue, "Repurposing EGFR inhibitor utility in colorectal cancer in mutant *APC* and *TP53* subpopulations," by Yang and colleagues. The findings of the study suggest that the *APC* and *TP53* combination mutation may account for the laterality of EGFRi sensitivity and provide a rationale for refining treated populations, and also that the addition of *APC*+*TP53* sequencing to extended *RAS*/*RAF* testing may directly increase the response rates of EGFRi therapy in selected patients. The original figure is a diagram of the CTX-S scores (high to low) vs. 7 MUT/WT *APC*/*TP53*/*RAS*(*KRAS*/*NRAS*)/*BRAF* subgroups in MSI and MSS tumors displayed for the Moffitt ( $n = 464$ ) dataset. For more information, see the article beginning on page 1141.
